SIC DATA-HACK 2026

The game page fans stay on

A redesigned game center that shows why the numbers mattered

Jaroslav Bezdek • HC Zabovresky

THE PROBLEM

1.3M

unique visits to Spengler Cup results pages during the five-day event

Most fans check the score and leave

Poor readability

A tall banner with score fills almost the whole screen; the overview and lineup are dense tables.

Inconsistencies and errors

Player names linked in some places only; a German stat legend on the English page.

Missing context

No way to sort players or see how a goal happened, so strong performances go unnoticed.

OUR ANSWER

Redesign the page fans already open

We kept what today's page shows and made it clear, consistent and correct. Then we added what it was missing: more team and individual stats and a replay of every goal from the tracking data.

Interactive

Sort players by any stat, switch between periods and lines, play goals at full or half speed.

Understandable

Every stat explained in plain words, in the page's language, so no fan is left out.

Engaging

Goal replays show the individual work behind each goal, the performances today's page misses.

In the demo, one switch flips between the current page and the redesigned page.

Getting fans into the game

Part	Current page	Redesigned page	Why
Hero	A tall banner fills the first screen, hiding the rest	A compact hero; the game overview starts clearly on the first screen	The score and the game overview are visible without scrolling
Overview	An overview that is hard to read	A clear timeline of goals and penalties with interactive links	The course of the game reads at a glance
Players	Player names linked only in Lineup	Every player name links to the player's profile	One consistent rule: any player profile is one tap away
Goals	No replay	A top-down replay of each goal from the tracking data, at full or half speed	A visual way into the game that shows the individual work behind each chance
Languages	Language versions that don't work properly, e.g. German text on the English page	Working English and German versions of the whole page	Fans can read the whole page in their language, with no mixed-up text

Making the numbers readable

Part	Current page	Redesigned page	Why
Lineup	A table that is hard to read	Each line drawn on a rink, with links to player profiles	Shows where each player actually plays, and against which opponent
Team stats	4 stats	18 stats, from expected goals to saves above expected	A fuller picture of the game: chance quality, puck control and goaltending
Player stats	Tables that cannot be sorted	Sortable tables, grouped by team and position	Find the best player in any stat and compare players directly
Stat legend	Below the team stats only; missing on player stats	A description for every stat, on team and player stats	Fans without hockey knowledge can follow too

HOW IT WORKS

From tracking data to the page

Raw exports

scoreTec event data and player aggregates

Python

Data transformation pipeline creates 4 feeds: game flow, team stats, player stats, goal replays

Next.js page

Pre-rendered at build time: no server, no database

Vercel

Public demo is deployed via Vercel, rebuilt on every push

Real data stays private

The confidential data never leaves the laptop. A simulated match with the same schema runs the public demo and repo; one setting switches to the real data.
